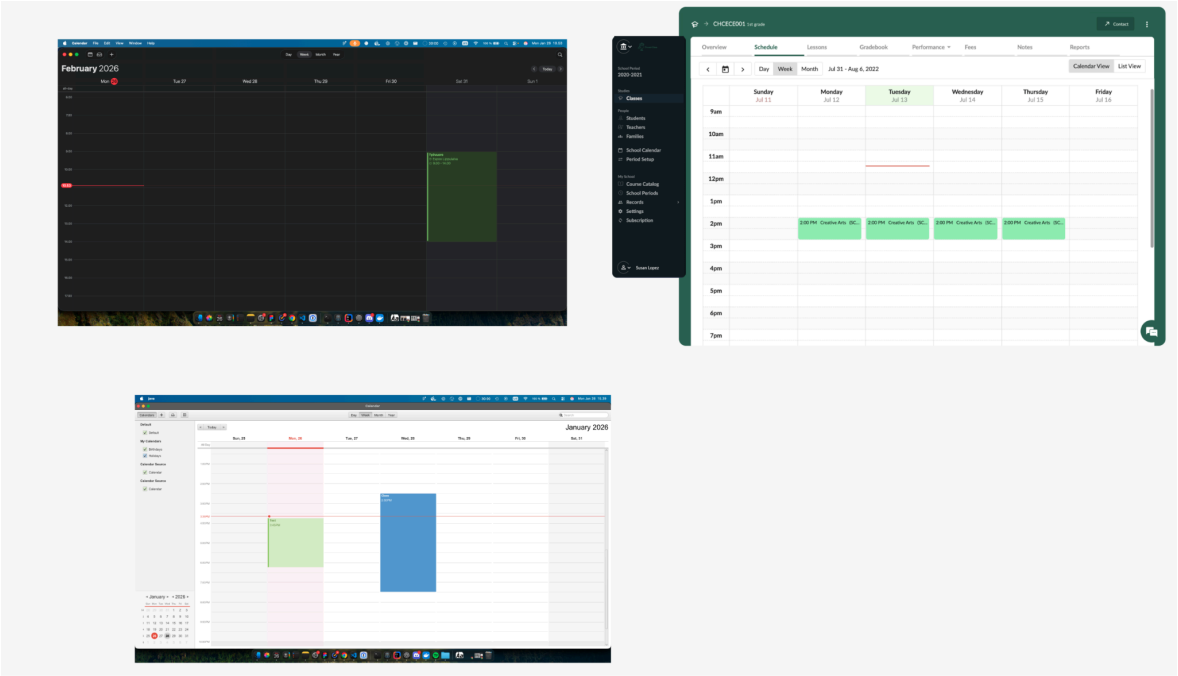
Tools used

We used Figma to create our apps design. For our icons we used the svgrepo.com.

Inspiration

We first started with inspiration for our app. We liked the colors of the example on top right. Also we liked the simplicity of apples own calendar app (top left). Below is the default calendar view of the JavaFX CalendarFX library. We figured we can use much of the already made template.

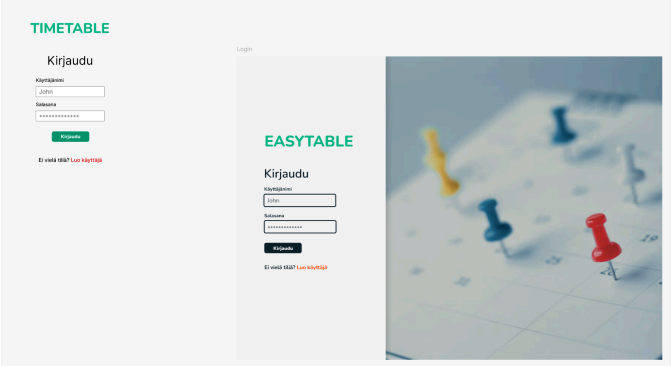


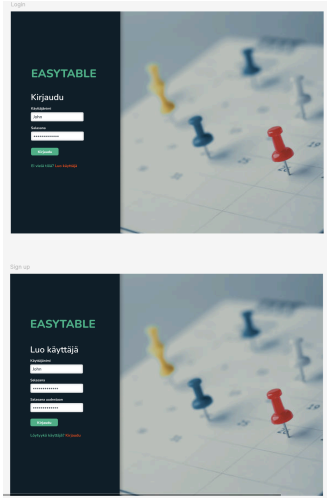
Colors and style

We gathered the key colors and fonts we would use for our app based on the above inspiration. We wanted the app to be clean and minimal. The logo was meant to look friendly and clean and was created from scratch using the Nunito font.

Auth page

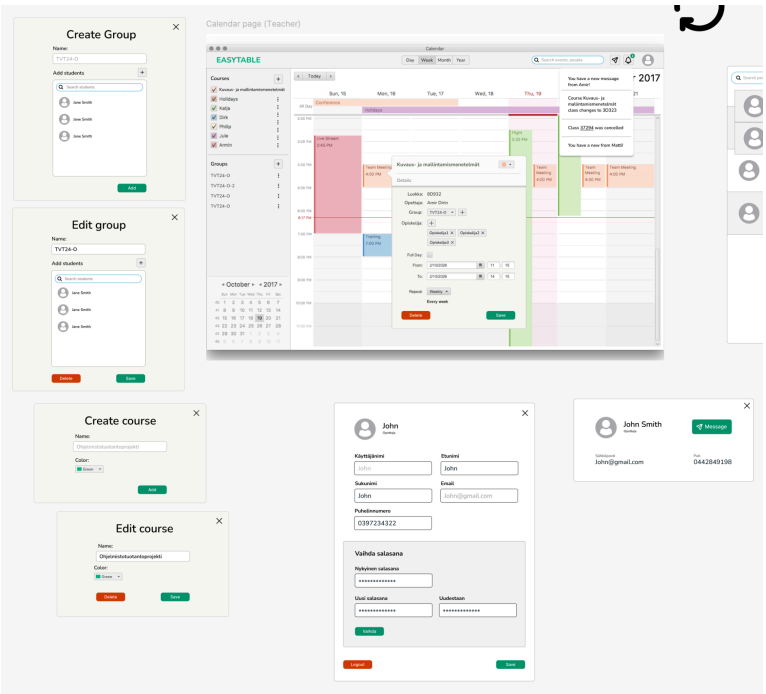
We ended up liking the dark version (on right) better than the light version.

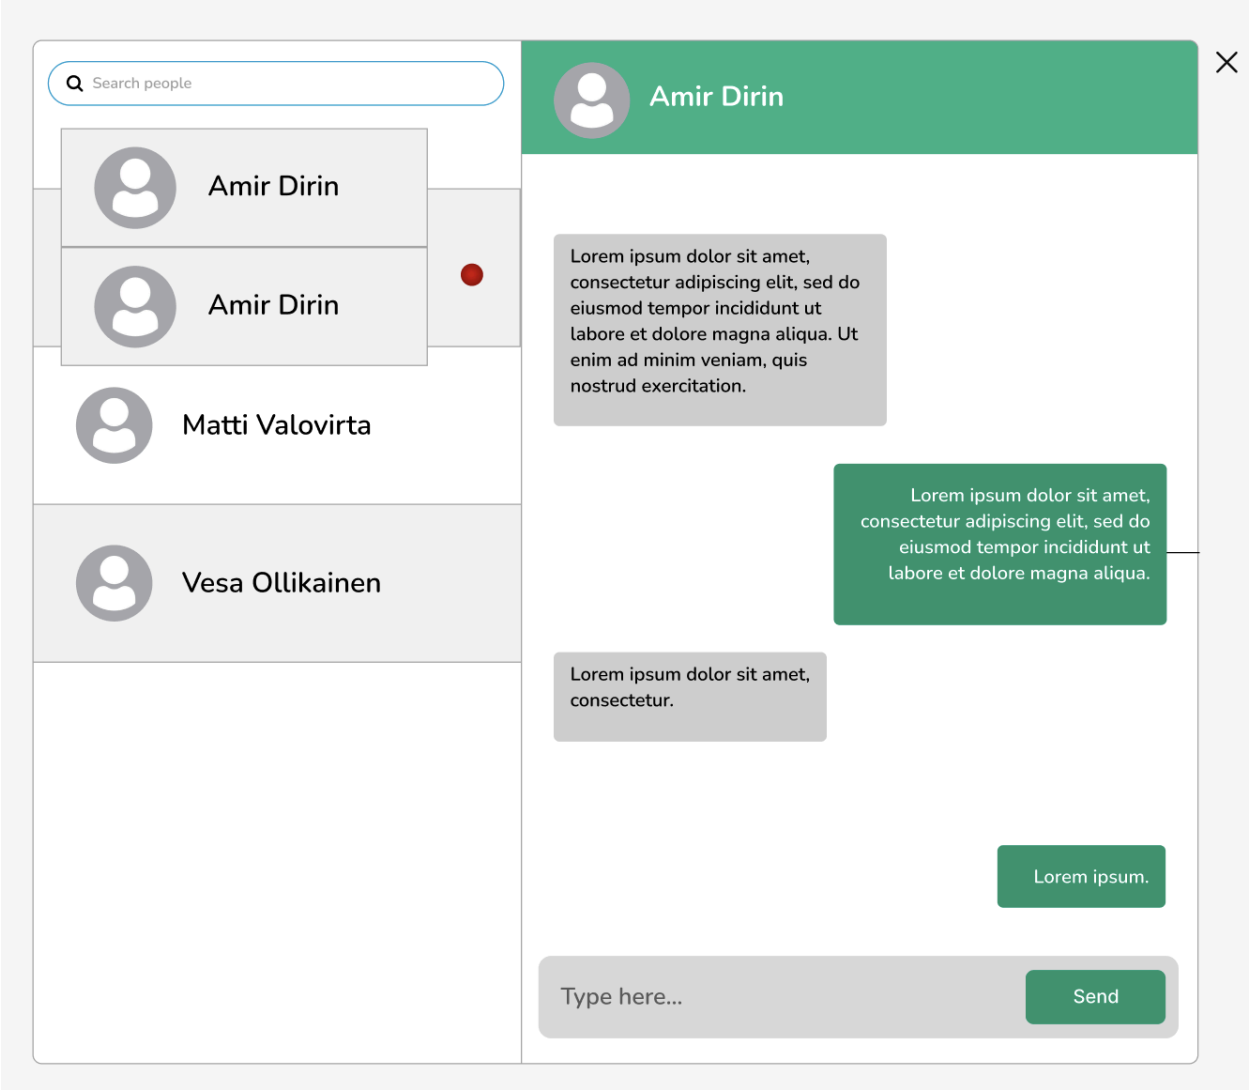




Main app & modals

I started designing over a screenshot of CalendarFX default view to make it fit our needs. I modified the navbar, added new section to sidebar for groups, and added more options for the lesson creation popup. The modals were created entirely from scratch to fit the style of the main page.



Messaged modal


The messages modal was designed to have the same theme as throughout our app using colors from our guide.
